Low expenditure ...

Labour saving

Our budding-tie settles the constant problem of obtaining staff, as it does not require professionals to perform the task. After a short period of training, tiers can easily achieve a rate of 400 - 500 per hour, while some even manage up to 600. As a result of this extraordinary achievement, a more advantageous staff assignment is possible and one tier can easily serve two budders.

Self-disposal of bandage

The ties do not have to be removed as the thin high-quality budding rubber is subjected to atmospheric conditions and self disposable within 3 or 4 weeks.

Protection against insects

Until they dissolve, the budding-tie provides first-class protection against all insects.

Unobstructed growth

Our OKULETTE budding-tie guarantees an unobstructed growth in thickness, which is essential for the development of the bud.

... of time and wages

Okulette®

Guaranteed cultivating success...

Better growth

In addition to the bud being tightly enclosed, the elasticity of the rubber also seals the cut, made in the root-stock.

Absolute air and water tightness, together with even pressure on the bud, promotes the growth of the bud considerably.

Inexpensive budding techniques

Excellent growth together with the saving of time and wages makes the OKU-LETTE an extremely low cost tie.

Environmental Friendly

Compared with plastic budding-tie material, our budding-ties are made of natural caoutchouc and cause no damage to the environment, as they decompose completely.

Quality

We produce the complete budding-tie from raw caoutchouc to the finished product and use only selected types of raw caoutchouc from identical plantations to guarantee a consistently high quality.
